

Use Gaussian Elimination to solve Linear Systems:

Apply Row Operations to the rows of the whole augmented matrix until the coefficient matrix is in RREF.

From the coefficient matrix in its RREF:

- 1) Decide if the system is consistent

If it is consistent:

- 2) Assign parameters to the non-leading variables
- 3) Solve for leading variables in terms of parameters

Note: All decisions in the algorithm will only depend on the coefficient matrix

Definition: The "Rank" of a matrix A, denoted by $\text{rank}(A)$ is the number of leading ones (pivots) determine the REF of A

Example:

Matrix:

$$\begin{bmatrix} 1 & 2 & 3 \end{bmatrix} = A = \text{rank}(a)$$

Note: The rank does not change when we do elementary row operations and it can not exceed the number of columns or rows of A

Notation: $[A | b]$, where a is the coefficient matrix and b is the constants matrix

We can determine if a system is consistent or not by comparing the ranks of A & $[A | B]$ suppose we reduce A in $[A | b]$ to its RREF:

$$\text{Rank}(A) \leq \text{Rank}([A|b]) \leq \text{Rank}(A)+1$$

Summary

- 1) The system is inconsistent iff $\text{Rank}(A) < \text{Rank}([A | b])$
- 2) The system has a unique solution iff $\text{Rank}(A) == \text{Rank}([A | b])$ **AND** $\text{rank}(A) = \#$ of columns of A
- 3) The system has infinitely many solutions iff $\text{Rank}(A) = \text{Rank}([A | b])$ **AND** $\text{Rank}(A) < \#$ columns of A

Applications:

I) Network and Traffic Flow Problem:

Goal: Model the internal flow of a network - We don't expect a unique solution

300 > a < x1 b 100 >

<u>Nodes</u>	<u>In</u>	<u>Out</u>
a	300+x2	x1
b	x1	x3+100
c	x3+x4	200 + 300
d	300	x2 + x4

$$X1 - X2 = 300$$

$$X1 - X3 = 100$$

$$X3 + X4 = 500$$

$$X2 + X4 = 300$$

Matrix [A | b]:

$$1 \ -1 \ 0 \ 0 \ | \ 300$$

$$1 \ 0 \ -1 \ 0 \ | \ 100$$

$$0 \ 0 \ 1 \ 1 \ | \ 500$$

$$0 \ 1 \ 0 \ 1 \ | \ 300$$

Reduce to REF / RREF:

X1	X2	X3	X4	Const.
1	0	0	1	600
0	1	0	1	300
0	0	1	1	500
0	0	0	0	0

X4 does not have a leading 1

$$X4 = S$$

$$X_1 + S = 600$$

$$X_2 + S = 300$$

$$X_3 + S = 500$$

$$X_1 \quad \quad \quad 600 - S$$

$$X_2 \quad - \quad 300 - S$$

$$X_3 \quad - \quad 500 - S$$

$$X_4 \quad \quad \quad S$$

Assuming $X_i \geq 0$

$$0 \leq S \leq 300 \text{ where } S \in \mathbb{R}$$

II) Testing scenarios

Find all possible values of k , such that the following system has either:

(a) No solutions

(b) A Unique Solution

(c) infinitely many solutions

$$kx + y + z = 1$$

$$x + ky + z = 1$$

$$x + y + kz = 1$$

$$\begin{array}{ccc|c} k & 1 & 1 & 1 \\ 1 & k & 1 & 1 \\ 1 & 1 & k & 1 \end{array} \quad \begin{array}{l} R1 \\ R2 \\ R3 \end{array}$$

$$\begin{array}{ccc|c} 1 & k & 1 & 1 \\ k & 1 & 1 & 1 \\ 1 & 1 & k & 1 \end{array} \quad \begin{array}{l} R2 \\ R1 \\ R3 \end{array}$$

$$\begin{array}{ccc|c} 1 & 1 & k & 1 \end{array} \quad R3$$

$$R1 \leftrightarrow R2$$

$$\begin{array}{ccc|c} 1 & k & 1 & 1 \\ k & 1 & 1 & 1 \\ 1 & 1 & k & 1 \end{array} \quad \begin{array}{l} R2 \\ R1 \\ R3 \end{array}$$

$$\begin{array}{ccc|c} k & 1 & 1 & 1 \\ 1 & 1 & k & 1 \end{array} \quad \begin{array}{l} R1 \\ R3 \end{array}$$

$$\begin{array}{ccc|c} 1 & 1 & k & 1 \end{array} \quad R3$$

$$-kR1 + R2 \rightarrow R2$$

$$-R1 + R3 \rightarrow R3$$

$$\begin{array}{ccc|c} 1 & k & 1 & 1 \\ 0 & 1-k^2 & 1-k & 1-k \\ 0 & 1-k & k-1 & 0 \end{array} \quad \begin{array}{l} R2 \\ R1 \\ R3 \end{array}$$

$$\begin{array}{ccc|c} 0 & 1-k^2 & 1-k & 1-k \\ 0 & 1-k & k-1 & 0 \end{array} \quad \begin{array}{l} R1 \\ R3 \end{array}$$

$$\begin{array}{ccc|c} 0 & 1-k & k-1 & 0 \end{array} \quad R3$$

$$\begin{array}{ccc|c}
 1 & k & 1 & 1 & R2 \\
 0 & 1-k^2 & 1-k & 1-k & R1 \\
 0 & 1-k & k-1 & 0 & R3
 \end{array}$$

Cases:

1)

If $K = 1$:

$X_1 \quad X_2 \quad X_3 \Rightarrow X_2 \text{ \& } X_3 \text{ are non-leading}$

2)

$K \neq 1$

$K - 1 \neq 0$

III) Solving vector equations

Does the set $\{(1,2,3), (4,5,6), (7,8,9)\}$ Span \mathbb{R}^3

Do there exist scalars a_1, a_2, a_3 such that

$$a_1(1,2,3) + a_2(4,5,6) + a_3(7,8,9) = (x,y,z) \text{ in } \mathbb{R}^3$$

$$a_1 + 4a_2 + 7a_3 = x$$

$$2a_1 + 5a_2 + 8a_3 = y$$

$$3a_1 + 6a_2 + 9a_3 = z$$

Augmented Matrix

$$\begin{array}{ccc|c}
 1 & 4 & 7 & x \\
 2 & 5 & 8 & y \\
 3 & 5 & 8 & z
 \end{array}$$

After Row Reduction:

$$\begin{array}{ccc|c}
 1 & 4 & 7 & x \\
 0 & 1 & 2 & -(y-2x)/3 \\
 0 & 0 & 0 & x-2y+z
 \end{array}$$

For the system to be consistent we have to get rid of the homogeneous equation $(x - 2y + z)$

Since they can only span a plane, They do NOT have the ability to span \mathbb{R}^3 A.K.A. They are LD.
